SUMMARY

DevOps & Cloud Engineer with 2+ years of experience delivering production-grade infrastructure on AWS, Azure, and GCP. Bring the ability to design and automate complete cloud environments from network architecture and IAM design to container orchestration, CI/CD delivery, and integrated security scanning. Approach every system with a security-first mindset, treating least-privilege access, centralized secrets management, and encryption in transit as baseline defaults.

TECHNICAL SKILLS

Cloud & Infrastructure: AWS (EC2, EKS, VPC, ALB, ASG, RDS, S3, IAM, ACM, AMI), Azure (VM, AKS, AG, VMSS, Azure SQL, Blob Storage, Entra ID), GCP (Compute Engine, GKE, Cloud Storage, Certificate Manager)

Infrastructure as Code & Config Management: Terraform, Ansible, CloudFormation

Security & Compliance: IAM Least-Privilege, SSM Secrets Management, TLS/SSL, Network Segmentation, Security Groups, Encryption in Transit

Containers & Orchestration: Docker (multi-stage builds, private registries), Kubernetes (Deployments, StatefulSets, Headless Services, HPA, PV, PVC, SC, RBAC, Ingress, IRSA/OIDC), Helm Charts.

Continuous Integration/Continuous Delivery (CI/CD) & Automation: Jenkins (pipelines, shared libraries, Groovy), GitHub Actions, ArgoCD, AWS CodePipeline, Bash Scripting.

Languages: Python, SQL, Golang, Java, JavaScript, Nodejs, C#, Groovy, Bash.

Databases: MySQL, PostgreSQL, MongoDB, Redis, RabbitMQ, Kafka, DynamoDB.

Monitoring & Observability: Prometheus, Grafana, ELK Stack, CloudWatch.

WORK EXPERIENCE

Eco Servants

October 2025 - June 2026

Software Engineer Intern

California, USA

- Developed and maintained backend APIs across Python, Java, and PHP services, implementing endpoints that integrated environmental datasets with internal dashboards and improved data availability across the CSR platform.
- Debugged application defects across development and production environments through structured log analysis and execution tracing, reducing recurring failure patterns and improving overall service stability.
- Contributed to CI/CD workflow maintenance, supporting automated build and deployment across multiple services and enabling faster, more consistent release cycles across the engineering team.

Vesonix TechLabs

June 2022 - August 2023

Applications & Cloud Engineer

Hyderabad, India

- Built and maintained Docker images for internal microservices using multi-stage builds and minimal base images, reducing image sizes significantly and streamlining deployments across development environments.
- Managed Kubernetes workloads in development and staging clusters configured Deployments, Services, and ConfigMaps, monitored pod health, and resolved container-level failures during active release cycles.
- Maintained CI/CD pipelines in GitHub Actions, contributing to automated build and test workflows that improved release reliability and shortened feedback loops for the engineering team.
- Configured cloud infrastructure for non-production environments on AWS including IAM policies, security groups, and network segmentation aligned with internal access standards and audit requirements.

Adqura Pvt. Ltd.

March 2022 - May 2022

Software Developer

Hyderabad, India

- Developed backend API endpoints in Python, implementing request validation, business logic, and database integration to support core application workflows.
- Built and maintained automated test suits covering unit and integration scenarios, improving code coverage and catching regressions earlier in the development cycle.
- Resolved application defects across development and testing environments through structured log analysis and execution tracing, reducing pre-production failure rates.

PROJECTS

Production Microservices Infrastructure - 10-Layer IaC Architecture | [Git](#)

Terraform, IaC, Cloud Networking, ALB, ACM, DNS, ECS, VPN, CDN, Remote State, SSM, S3, EC2, Route53, Ansible, CloudTrail, CloudFormation.

- Architected the complete cloud network foundation using custom reusable Infrastructure-as-Code modules, provisioning a multi-AZ virtual private network with public, private, and database subnets, Internet Gateway, NAT Gateway with Elastic IP, and dynamically generated service-specific security groups where rule sets are decoupled from group creation to eliminate circular dependencies.
- Deployed the ingress and edge security layer with a public-facing Application Load Balancer, a wildcard TLS certificate with automated DNS-based validation, and a global Content Delivery Network with path-based cache behaviors, along with a private container registry for internal image storage ensuring encrypted traffic at the edge and no reliance on public image sources.
- Established a secure private administrative access layer with a hardened Bastion host in the public subnet and a self-hosted VPN server allowing direct, encrypted developer-to-backend connectivity, along with a VPC Peering connection between the platform network and a separate CI/CD network enabling internal-only cross-environment traffic without any public internet exposure.
- Managed all Infrastructure-as-Code state remotely with cross-layer resource references decoupled through a centralized parameter store, enabling independent and safe modification of any infrastructure layer without impacting the rest of the system.

Containerized Microservices Platform - Kubernetes Orchestration & Helm Packaging | [Git](#)

Docker, Alpine, K8s, Deployments, Headless Services, HPA, PV, PVC, RBAC, IRSA, OIDC, Ingress Controller, Helm Charts.

- Built optimized container images for a 10-service polyglot platform using multi-stage builds on Alpine base images, installing build-time tooling only in intermediate stages and copying compiled artifacts into slim runtime stages, with non-root user execution enforced through explicit UID/GID assignment to eliminate privileged-container risks.
- Authored production-grade Kubernetes manifests covering both stateless and stateful workloads Deployments and ClusterIP Services for application layers, StatefulSets with Headless Services and volumeClaimTemplates for databases, block-storage-backed StorageClass with delayed volume binding to guarantee correct availability-zone placement, and ConfigMaps mounted both as bulk environment variables and as file mounts at specific paths.
- Implemented in-cluster security and reliability controls including role-based access with dedicated ServiceAccounts, Roles, RoleBindings, and ClusterRoleBindings for multi-user access separation, and pod-to-cloud authentication through federated identity trust between Kubernetes ServiceAccounts and cloud IAM roles, eliminating static credentials from container workloads with liveness and readiness probes tuned per service type.
- Exposed application traffic through an Ingress Controller with host and path-based routing rules and packaged the entire platform as reusable Helm charts using values-driven templating with separate chart archetypes for stateless versus stateful workloads, enabling any team member to deploy the full platform to a new environment with a single command.

Automated CI/CD Pipeline - Security Integrated Delivery on Kubernetes | [Git](#)

Jenkins, Groovy, SonarQube, Trivy, Dependabot, GitHub, Quality Gates, SAST, DAST, Container Vulnerability Scanning

- Architected end-to-end CI/CD pipelines for containerized microservices with integrated functional testing, static code analysis, API testing, SAST, and DAST, with the entire Jenkins delivery infrastructure (controller, dedicated agent node, and SonarQube instance) provisioned end-to-end using IaC and configured through automated bootstrap scripts, replacing hours of manual VM setup and tool configuration with a single reproducible deployment.
- Enforced code quality and container security through a SonarQube static analysis stage that scans the codebase and blocks pipeline progression on any quality gate failure, followed by container image build and push to a private registry with version-tagged artifacts, and Trivy image scanning that halts deployment on any critical or high-severity vulnerability discovered in the built image.
- Implemented least-privilege secrets management using a centralized credentials store with stage-scoped credential injection for GitHub personal access tokens, cloud IAM credentials, SonarQube authentication tokens, and SSH agent authentication eliminating plain-text secrets from pipeline code and minimizing blast radius by exposing each credential only within the specific stage that requires it.

- Engineered a reusable Groovy shared library that centralizes CI/CD logic across the entire service portfolio, with parameterized deployment workflows that provision environment-specific Kubernetes namespaces on demand and orchestrate rolling releases through Helm-based templating eliminating per-service pipeline duplication that historically caused maintenance drift and human error and enabling pipeline changes to propagate across every service through a single library update.

Cloud-Based Food Delivery System Multi-Cloud Deployment Strategy | [Blog](#)

Django, AWS EC2, Azure Web App, MySQL, Nginx, Unicorn, GitHub Actions

- Deployed the application across AWS and Azure in a multi-cloud architecture, reducing single-provider dependency and improving disaster recovery posture against regional outages, provider-level service degradations, and vendor lock-in risks.
- Hardened both deployments through automated CI/CD pipelines, TLS termination, IAM-scoped access controls, and strict network policies ensuring no database or internal service was exposed to the public internet across either cloud environment.

EDUCATION

University of Wisconsin Milwaukee

Aug 2023 – May 2025

Master of Science in Computer Science

Milwaukee, WI

Relevant Coursework: Cloud Computing, Cybersecurity, Database Systems, Machine Learning, NLP, Web Application Development

RESEARCH

Gandhi Institute of Technology and Management

March 2023

Research Assistant | [Springer ICDSAI 2023](#)

Visakhapatnam, India

- Designed and implemented an end-to-end sentiment classification pipeline that automatically scrapes, cleans, and processes large volumes of e-commerce product reviews through a multi-stage NLP workflow.
- Built and evaluated multiple machine learning classification models, optimizing for accuracy through cross-validation and confusion matrix analysis to identify the best-performing approach for real-world review data.
- Deployed the complete system as a Flask web application on AWS, enabling real-time sentiment prediction and word cloud visualization - with findings peer-reviewed and published in Springer ICDSAI 2023.
