SUMMARY

DevSecOps & Cloud Engineer with 2+ years of experience designing, automating, and securing production cloud infrastructure on AWS and Azure. Reduced environment setup by 40% and release turnaround by 25% through end-to-end pipeline automation. Architected zero-touch, self-healing infrastructure with security embedded at every layer-least-privilege access, secrets management, and encryption in transit as baseline standards. Published researcher, Springer ICDSAI 2023.

TECHNICAL SKILLS

Cloud & Infrastructure: AWS (EC2, VPC, ALB, ASG, RDS, S3, Route53, CloudFront, IAM, SSM, CloudWatch, ACM, CodePipeline), Azure.

Security & Compliance: IAM Least-Privilege, SSM Secrets Management, TLS/SSL, Network Segmentation, Security Groups, Encryption in Transit.

DevOps & CI/CD: Docker, Kubernetes, GitHub Actions, Nginx, Gunicorn, Linux, Bash Scripting.

Infrastructure as Code & Config Management: Terraform, Ansible, CloudFormation

Languages: Python, Bash, SQL, Java, JavaScript, Nodejs, c#.

Databases & Monitoring: MySQL, PostgreSQL, MongoDB, Redis, RabbitMQ, CloudWatch

WORK EXPERIENCE

Eco Servants

Nov 2025 - Present

Data Analyst & Research Intern

California, USA

- Built and maintained Python data pipelines processing real environmental datasets, applying geospatial logic to map field data and surface location-based metrics to internal dashboards using JavaScript/PHP tied to the CSR system.
- QA'd and published verified invasive-plant entries to the open Invasive Plant Field Guide standardizing taxonomy, attributes, and categories for consistency; supported analytics reporting via Google Analytics and social analytics dashboards.
- Integrated GitHub Copilot into daily development workflow while maintaining full code-review discipline, ensuring every AI-assisted output is reviewed and owned before it ships.

Vesonix TechLabs

June 2022 - August 2023

Applications & Cloud Engineer

Hyderabad, India

- Built and maintained backend services supporting internal cloud application workflows used across cross-functional teams, delivering reliable CRUD operations and REST API endpoints.
- Automated cloud infrastructure provisioning across development and staging environments, reducing manual setup time by 40% through fully codified and repeatable deployments.
- Designed CI/CD pipelines that automated build, test, and release workflows, cutting release turnaround by 25% and reducing human error across deployment stages.
- Secured service-to-database connectivity by implementing IAM-based authentication and least-privilege access controls, eliminating hardcoded credentials across all environments.

Adqura Pvt. Ltd.

March 2022 - May 2022

Software Developer

Hyderabad, India

- Automated issue-tracking and workflow routing using low-code process automation, reducing manual coordination effort by 30% across cross-functional teams.
- Strengthened pre-production reliability by systematically debugging case-processing flows through execution trace analysis, resolving failures before reaching production.
- Improved workflow consistency by standardizing routing logic, reducing process ambiguity and increasing handoff accuracy between teams.

PROJECTS

RoboShop Full Production Infrastructure – 10 Layer Terraform Architecture | [Git](#)

Terraform, AWS VPC/EC2/ALB/ASG/CloudFront/ACM/SSM, Ansible, Route53

- Architected a fully automated, zero-touch AWS production environment across 10 independently managed infrastructure layers, where each layer is isolated with its own remote state - eliminating cross-layer dependencies and enabling teams to modify any layer without risk to the rest of the system.
- Enforced security at the infrastructure level all inter-service communication governed by least-privilege network policies, secrets managed through a centralized parameter store with no credentials ever written to code, and all public traffic encrypted with TLS at the edge.
- Engineered a self-bootstrapping entry point that, once triggered, automatically provisions databases, bakes service images, configures all application services via Ansible, and deploys them behind an auto-scaling load-balanced architecture fully hands-free from first boot to live production.
- Secured the public endpoint with a managed wildcard certificate, TLS-enforced load balancer, and a CDN layer with intelligent caching for static assets and direct pass-through for API traffic.

RoboShop Infrastructure Automation – Ansible Roles Architecture | [Git](#)

Ansible, AWS EC2/Route53, SSM, Jinja2, amazon.aws

- Designed a unified configuration management system for a 10-service polyglot platform where any service regardless of runtime or dependency stack deploys through a single parameterized command, with shared setup logic defined once and inherited across all services.
- Eliminated credential exposure across all configuration workflows by integrating with a centralized secrets store, ensuring passwords and access keys are resolved at runtime and never stored in playbooks or version control.
- Standardized all service and proxy configurations as dynamic templates rendered at deploy time, ensuring environment-specific values are injected consistently and eliminating configuration drift across services.

Cloud-Based Food Delivery System | [Blog](#)

Django, AWS EC2, Azure Web App, MySQL, Nginx, Gunicorn, GitHub Actions

- Deployed the same application across AWS (IaaS) and Azure (PaaS) in parallel, comparing infrastructure control, scalability behavior, and operational overhead across both cloud models against a shared backend database.
- Hardened both deployments with automated CI/CD pipelines, TLS termination, IAM-scoped access controls, and strict network policies — ensuring no database or internal service was exposed to the public internet.

EDUCATION

University of Wisconsin Milwaukee

Aug 2023 – May 2025

Master of Science in Computer Science

Milwaukee, WI

Relevant Coursework: Cloud Computing, Cybersecurity, Database Systems, Machine Learning, NLP, Web Application Development

RESEARCH

Gandhi Institute of Technology and Management

March 2023

Research Assistant | [Springer ICDSAI 2023](#)

Visakhapatnam, India

- Designed and implemented an end-to-end sentiment classification pipeline that automatically scrapes, cleans, and processes large volumes of e-commerce product reviews through a multi-stage NLP workflow.
- Built and evaluated multiple machine learning classification models, optimizing for accuracy through cross-validation and confusion matrix analysis to identify the best-performing approach for real-world review data.
- Deployed the complete system as a Flask web application on AWS, enabling real-time sentiment prediction and word cloud visualization - with findings peer-reviewed and published in Springer ICDSAI 2023.
