SUMMARY

DevSecOps & Cloud Engineer with 2+ years of experience building, automating, and securing production cloud infrastructure across AWS and Azure. Architected zero-touch, self-healing systems where security is structural least-privilege access, centralized secrets management, and encryption in transit as baseline standards. Strong hands-on background in container orchestration with Docker and Kubernetes, infrastructure as code with Terraform and Ansible, and multi-cloud deployment strategy. Published researcher, Springer ICDSAI 2023.

TECHNICAL SKILLS

Cloud & Infrastructure: AWS (EC2, VPC, ALB, ASG, RDS, S3, Route53, CloudFront, IAM, SSM, CloudWatch, ACM, CodePipeline), Azure
Security & Compliance: IAM Least-Privilege, SSM Secrets Management, TLS/SSL, Network Segmentation, Security Groups, Encryption in Transit
Containers & Orchestration: Docker (multi-stage builds, Alpine optimization, non-root containers), Kubernetes (Deployments, StatefulSets, Services, ConfigMaps, HPA, PV/PVC, StorageClasses, RBAC, Ingress, IRSA/OIDC), Helm Charts, kubectl
DevOps & CI/CD: GitHub Actions, AWS CodePipeline, Nginx, Unicorn, Linux, Bash Scripting
Infrastructure as Code & Config Management: Terraform, Ansible, CloudFormation
Languages: Python, Bash, SQL, Java, JavaScript, Node.js, C#
Databases & Monitoring: MySQL, PostgreSQL, MongoDB, Redis, RabbitMQ, CloudWatch, Kafka, DynamoDB.

WORK EXPERIENCE

Eco Servants

Nov 2025 - Present

Data Analyst & Research Intern

California, USA

- Analyzed public engagement and audience response data from social media campaigns, paid advertisements, and outreach channels, surfacing performance trends and engagement patterns through reporting dashboards to guide future campaign strategy.
- Contributed to backend API development across Python, Java, and PHP services, implementing endpoints and data-processing scripts that connected environmental datasets to internal dashboards and the broader CSR platform.
- Integrated GitHub Copilot into the development workflow while maintaining strict code-review discipline, ensuring every AI-assisted output is reviewed, validated, and owned before it ships.

Vesonix TechLabs

June 2022 - August 2023

Applications & Cloud Engineer

Hyderabad, India

- Built and maintained optimized Docker images for internal microservices using multi-stage builds and lightweight base images, reducing image size and simplifying deployments across development environments.
- Supported Kubernetes deployments by managing ConfigMaps, Services, and Deployments; monitored pod health and helped troubleshoot container failures across development and staging clusters.
- Maintained GitHub Actions CI/CD workflows that automated build and test processes, improving release consistency and supporting faster engineering feedback loops.
- Assisted with AWS non-production infrastructure setup, including IAM, security groups, and network configuration, while working under senior engineer guidance.

Adqura Pvt. Ltd.

March 2022 - May 2022

Software Developer

Hyderabad, India

- Developed backend API endpoints in Python, implementing request validation, business logic, and database integration to support core application workflows.
- Built and maintained automated test suites covering unit and integration scenarios, improving code coverage and catching regressions earlier in the development cycle.
- Resolved application defects across development and testing environments through structured log analysis and execution tracing, reducing pre-production failure rates.

PROJECTS

Production Microservices Infrastructure - 10-Layer IaC Architecture | [Git](#)

Terraform, Ansible, AWS VPC/EC2/ALB/ASG/CloudFront/ACM/SSM, Route53, Jinja2

- Architected a fully automated, zero-touch production environment across 10 independently managed infrastructure layers, where each layer is isolated with its own remote state eliminating cross-layer dependencies and enabling teams to modify any layer without risk to the rest of the system.
- Enforced security at the infrastructure level all inter-service communication governed by least-privilege network policies, secrets managed through a centralized parameter store with no credentials ever written to code, and all public traffic encrypted with TLS at the edge.
- Engineered a self-bootstrapping entry point that automatically provisions databases, bakes service images, configures all application services, and deploys them behind an auto-scaling load-balanced architecture fully hands-free from first boot to live production.
- Layered Ansible-based configuration management on top of the infrastructure, where any service deploys through a single parameterized command using dynamic Jinja2 templates and runtime secret resolution eliminating configuration drift and credential exposure across all environments.

Containerized Microservices Platform - Kubernetes Orchestration & Helm Packaging | [Git](#)

Docker, Kubernetes, Helm, kubectl, Alpine Linux, ConfigMaps, StatefulSets, HPA, PV/PVC, RBAC

- Containerized a 10-service polyglot microservices platform (Node.js, Python, Java, MongoDB, MySQL, Redis, RabbitMQ) using multi-stage Docker builds on Alpine base images, with non-root user enforcement and consolidated image layers reducing final image sizes and eliminating build-time tooling from runtime containers.
- Deployed all services to a managed Kubernetes cluster with full production-grade manifests Deployments and Services for stateless workloads, StatefulSets with persistent storage for databases, ConfigMaps for environment driven configuration, and HPA for traffic-driven scaling.
- Implemented security and reliability controls across the cluster RBAC with role and role-binding configurations for multi-user access, IRSA-based pod-to-cloud authentication using OIDC instead of static credentials, and liveness/readiness probes with appropriate thresholds per service type.
- Packaged the entire deployment as reusable Helm charts with values-driven templating, enabling environment-specific deployments without code duplication and laying the foundation for repeatable installs across dev, staging, and production clusters.

Cloud-Based Food Delivery System Multi-Cloud Deployment Strategy | [Blog](#)

Django, AWS EC2, Azure Web App, MySQL, Nginx, Unicorn, GitHub Actions

- Deployed the application across AWS and Azure in a multi-cloud architecture, reducing single-provider dependency and improving disaster recovery posture against regional outages, provider-level service degradations, and vendor lock-in risks.

- Hardened both deployments through automated CI/CD pipelines, TLS termination, IAM-scoped access controls, and strict network policies ensuring no database or internal service was exposed to the public internet across either cloud environment.

EDUCATION

University of Wisconsin Milwaukee

Aug 2023 – May 2025

Master of Science in Computer Science

Milwaukee, WI

Relevant Coursework: Cloud Computing, Cybersecurity, Database Systems, Machine Learning, NLP, Web Application Development

RESEARCH

Gandhi Institute of Technology and Management

March 2023

Research Assistant | Springer ICDSAI 2023

Visakhapatnam, India

- Designed and implemented an end-to-end sentiment classification pipeline that automatically scrapes, cleans, and processes large volumes of e-commerce product reviews through a multi-stage NLP workflow.
- Built and evaluated multiple machine learning classification models, optimizing for accuracy through cross-validation and confusion matrix analysis to identify the best-performing approach for real-world review data.
- Deployed the complete system as a Flask web application on AWS, enabling real-time sentiment prediction and word cloud visualization - with findings peer-reviewed and published in Springer ICDSAI 2023.
