SUMMARY

Software & Cloud/DevOps Engineer with 2+ years of experience building scalable backend systems, automating cloud infrastructure, and deploying distributed applications on AWS and Azure. Published researcher (Springer ICDSAI 2023). Proficient in Python, Django, Bash, Ansible, Terraform, Docker, and CI/CD pipelines

EDUCATION

University of Wisconsin Milwaukee

Aug 2023 – May 2025

Master of Science in Computer Science - GPA: 3.26/4.00

Milwaukee, WI

Coursework: ML, NLP, Database Systems, Cloud Computing, Cybersecurity, Web Application Development, JVM, multithreading, sampling-based, multi-robot, motion algorithms

TECHNICAL SKILLS

Programming Languages: Python, Java, SQL, JavaScript, C#, Bash

Frameworks & Web: Flask, Django, React.js, HTML, CSS

Cloud & IaC: AWS (EC2, RDS, S3, ALB, ASG, Route53, CloudFront, SSM, IAM, CloudWatch), Azure, Terraform, Ansible, CloudFormation

DevOps: Docker, Kubernetes, GitHub Actions, AWS CodePipeline, Nginx, Gunicorn, Linux

Databases & Analytics: MySQL, PostgreSQL, Snowflake, MongoDB, Power BI, Tableau, Microsoft Excel, Pandas, NumPy

WORK EXPERIENCE

Eco Servants

Nov 2025 - Present

Data Analyst & Research Intern

California, USA

- Built and maintained Python data pipelines processing real environmental datasets, applying geospatial logic to map field data and surface location-based metrics to internal dashboards using JavaScript/PHP tied to the CSR system.
- QA'd and published verified invasive-plant entries to the open Invasive Plant Field Guide standardizing taxonomy, attributes, and categories for consistency; supported analytics reporting via Google Analytics and social analytics dashboards.
- Integrated GitHub Copilot into daily development workflow while maintaining full code-review discipline, ensuring every AI-assisted output is reviewed and owned before it ships.

Vesonix TechLabs

June 2022 - June 2023

Applications & Cloud Engineer

Hyderabad, India

- Built backend services in Python (Flask/Django) supporting CRUD workflows for an internal cloud application used across cross-functional teams.
- Provisioned AWS infrastructure using CloudFormation/Terraform (EC2, VPC, subnets, SGs), cutting manual environment setup by ~40%.
- Engineered CI/CD pipelines with GitHub Actions and AWS CodePipeline/CodeBuild, reducing release turnaround by ~25%.
- Integrated app with AWS RDS via IAM-based secure connectivity; configured CloudWatch alarms for proactive runtime monitoring.

Adqura Pvt. Ltd.

March 2022 - May 2022

Software Developer

Hyderabad, India

- Automated issue-tracking and workflow routing using Pega Dev Studio, reducing manual coordination effort by ~30%.
- Debugged case-processing flows via execution traces, improving pre-production workflow stability.

RESEARCH

Gandhi Institute of Technology and Management

March 2023

Research Assistant | [Springer ICDSAI 2023](#)

Visakhapatnam, India

- Developed an end-to-end sentiment analysis pipeline by scraping and preprocessing large volumes of product reviews using Python, BeautifulSoup, Selenium, NLTK, and spaCy, enabling scalable text analytics.
- Built and optimized ML models (Naive Bayes, Logistic Regression, SVM) using TF-IDF features and deployed the workflow on AWS, identifying EC2 as the most efficient platform for NLP workloads.
- Published findings in Springer (ICDSAI 2023), demonstrating how automated sentiment classification and word-cloud visualization can support e-commerce platforms in understanding customer feedback and product perception.

PROJECTS

RoboShop Full Production Infrastructure – 10 Layer Terraform Architecture | [Git](#)

Terraform, AWS VPC/EC2/ALB/ASG/CloudFront/ACM/SSM, Ansible, Route53

- Architected 10 independently state-managed Terraform layers with S3 remote backends; cross-layer resources referenced via SSM Parameter Store zero hardcoded values.
- Built self-bootstrapping Bastion that auto-applies DB and service Terraform layers on first boot, and triggers Ansible playbook execution per service fully hands-free provisioning.
- Deployed 6 app services via a single for_each loop driving AMI baking, Launch Templates, ASGs with rolling refresh, ALB rules, and CPU-based target tracking scaling policies. Secured public endpoint with wildcard ACM cert, TLS 1.3 ALB, and CloudFront distribution with optimized caching for static assets and pass-through for API traffic.

RoboShop Infrastructure Automation – Ansible Roles Architecture | [Git](#)

Ansible, AWS EC2/Route53, SSM, Jinja2, amazon.aws

- Refactored flat per-service playbooks into a full Roles architecture; any service deploys with one command using \$service_name parameterization zero code duplication across 10 roles.
- Integrated AWS SSM Parameter Store for secrets (SSH passwords, MySQL root creds) via amazon.aws lookup plugin; rendered all systemd unit files and Nginx configs as Jinja2 templates.

RoboShop Microservices Deployment Automation (Shell → Common Library) | [Git](#)

Bash, AWS EC2/CLI, Route53, Node.js, Java/Maven, Python

- Authored 13 modular Bash scripts to provision and deploy a 10-service polyglot e-commerce platform; refactored into a common.sh library reducing each service script from ~70 lines to <10.
- Automated EC2 provisioning and Route53 DNS registration via AWS CLI; implemented set -euo pipefail, trap ERR, VALIDATOR(), and idempotent service/DB creation throughout.

Cloud-Based Food Delivery System | [Blog](#)

Django, AWS EC2, Azure Web App, MySQL, Nginx, Gunicorn, GitHub Actions

- Deployed a full-stack Django application on both AWS EC2 (IaaS) and Azure Web App (PaaS) with GitHub-based CI/CD, shared Azure MySQL backend, TLS via Certbot, and IAM/SG-based access controls.
