SUMMARY

DevOps & Cloud Engineer with 4+ years of experience delivering production-grade infrastructure on AWS, Azure, and GCP. Bring the ability to design and automate complete cloud environments from network architecture and IAM design to container orchestration, CI/CD delivery, and integrated security scanning. Approach every system with a security-first mindset, treating least-privilege access, centralized secrets management, and encryption in transit as baseline defaults.

TECHNICAL SKILLS

Cloud & Infrastructure: AWS (EC2, EKS, VPC, ALB, ASG, RDS, S3, IAM, ACM, AMI), Azure (VM, AKS, AG, VMSS, Azure SQL, Blob Storage, Entra ID), GCP (Compute Engine, GKE, Cloud Storage, Certificate Manager)

Infrastructure as Code & Config Management: Terraform, Ansible, CloudFormation

Security & Compliance: IAM Least-Privilege, SSM Secrets Management, TLS/SSL, Network Segmentation, Security Groups, Encryption in Transit

Containers & Orchestration: Docker (multi-stage builds, private registries), Kubernetes (Deployments, StatefulSets, Headless Services, HPA, PV, PVC, SC, RBAC, Ingress, IRSA/OIDC), Helm Charts.

Continuous Integration/Continuous Delivery (CI/CD) & Automation: Jenkins (pipelines, shared libraries, Groovy), GitHub Actions, ArgoCD, AWS CodePipeline, Bash Scripting.

Languages: Python, SQL, Golang, Java, JavaScript, Nodejs, C#, Groovy, Bash.

Databases: MySQL, PostgreSQL, MongoDB, Redis, RabbitMQ, Kafka, DynamoDB.

Monitoring & Observability: Prometheus, Grafana, ELK Stack, CloudWatch.

WORK EXPERIENCE

Powermind Solutions Inc

February 2024 – Present
United States

DevSecOps & Cloud Engineer

- Architect production-grade AWS infrastructure for client-facing consulting engagements using Terraform, EKS, EC2, RDS, S3, VPC, ALB, and Auto Scaling Groups provisioning multi-region, multi-account enterprise cloud environments through custom reusable Infrastructure-as-Code modules that reduce client onboarding time from days to hours and eliminate configuration drift across development, staging, and production environments.
- Orchestrate containerized microservices on Kubernetes (EKS) through production workloads, auto-scaling policies, service networking, and identity-based access controls sustaining high availability across 20+ production services while eliminating static credentials from application workloads and enforcing least-privilege access at every layer.
- Modernize CI/CD delivery workflows with Jenkins, reusable pipeline libraries, ArgoCD, Docker, and automated quality gates supporting 30+ production deployments monthly, accelerating release cycles, and enabling reliable rollback through version-controlled deployment tracking.
- Fortify cloud and software supply chain security by integrating code and application security scanning (SonarQube, Trivy), automated dependency alerts (Dependabot), least-privilege IAM policies, secure credentials management, and encryption in transit as baseline defaults ensuring no artifact reaches production without passing every security and quality check.
- Establish end-to-end observability with Prometheus, Grafana, and the ELK Stack building custom dashboards tracking node resource utilization, application health, auto-scaling behavior, and centralized log aggregation accelerating incident triage and enabling proactive detection of resource pressure before it impacts client services.
- Integrate ArgoCD automated deployment synchronization for continuous Kubernetes delivery across multi-environment enterprise cloud landing zones treating version control as the single source of truth, eliminating manual deployment steps, and enforcing infrastructure-as-code guardrails across teams.

Vesonix TechLabs

January 2022 - August 2023
Hyderabad, India

Applications & Cloud Engineer

- Built and maintained Docker images for internal microservices using multi-stage builds and minimal base images, reducing image sizes significantly and streamlining deployments across development environments.
- Managed Kubernetes workloads in development and staging clusters, configuring Deployments, Services, and ConfigMaps, monitoring pod health, and resolving container-level failures during active release cycles.
- Built and maintained Prometheus and Grafana observability dashboards tracking node CPU, pod health, and HPA behaviour across Kubernetes environments, enabling the team to detect resource pressure and scaling events before they impacted service availability.
- Ingested Kubernetes container logs into an ELK Stack pipeline for centralized search and analysis, accelerating incident triage during deployment issues and reducing mean time to root-cause identification.
- Maintained CI/CD pipelines in GitHub Actions and contributed small changes to internal Golang and Python services and utilities, supporting build automation and release-related tooling used across the engineering team.
- Supported an existing Kafka messaging setup through active monitoring and consumer-lag debugging, and configured non-production AWS infrastructure including IAM policies, security groups, and network segmentation aligned with internal access standards.

PROJECTS

Production Microservices Infrastructure - 10-Layer IaC Architecture | [Git](#)

Terraform, IaC, Cloud Networking, ALB, ACM, DNS, ECR, VPN, CDN, Remote State, SSM, S3, EC2, Route53, Ansible, CloudTrail, CloudFormation.

- Reduced multi-service infrastructure setup from hours of manual provisioning to a single reproducible deployment by architecting a custom Terraform module system provisioning a multi-AZ virtual private network with public, private, and database subnets, Internet Gateway, NAT Gateway with Elastic IP, and dynamically generated service-specific security groups where rule sets are decoupled from group creation to eliminate circular dependencies.
- Hardened public traffic and administrative access through a public-facing Application Load Balancer with a wildcard TLS certificate, global Content Delivery Network with path-based cache behaviors, and a private container registry paired with a hardened Bastion host and self-hosted VPN server for encrypted developer-to-backend connectivity.
- Enabled internal-only cross-environment traffic between the platform network and a separate CI/CD network by configuring VPC Peering with least-privilege routing, eliminating any public internet exposure for deployment traffic.
- Managed all Infrastructure-as-Code state remotely with cross-layer resource references decoupled through a centralized parameter store, enabling independent and safe modification of any infrastructure layer without impacting the rest of the system.

Containerized Microservices Platform - Kubernetes Orchestration & Helm Packaging | [Git](#)

Docker, Alpine, Kubernetes, Deployments, Headless Services, HPA, PV, PVC, RBAC, IRSA, OIDC, Ingress Controller, Helm Charts.

- Reduced container image sizes and eliminated privileged-container risks by building optimized multi-stage Docker images on Alpine base with build tooling isolated to intermediate stages and non-root user execution enforced through explicit UID/GID assignment.
- Authored production-grade Kubernetes manifests covering both stateless and stateful workloads Deployments and ClusterIP Services for application layers, StatefulSets with Headless Services and volumeClaimTemplates for databases, block-storage-backed StorageClass with delayed volume binding for correct availability-zone placement, and ConfigMaps mounted both as bulk environment variables and as file mounts at specific paths.
- Implemented in-cluster security and reliability controls including RBAC with dedicated ServiceAccounts, Roles, RoleBindings, and ClusterRoleBindings for multi-user access separation, and pod-to-cloud authentication through federated identity trust between Kubernetes ServiceAccounts and cloud IAM roles eliminating static credentials from container workloads.
- Packaged the entire platform as reusable Helm charts with values-driven templating and separate chart archetypes for stateless versus stateful workloads, enabling any team member to deploy the full platform to a new environment with a single command.

Automated CI/CD Pipeline – Security Integrated Delivery on Kubernetes | [Git](#)

Jenkins, Groovy, SonarQube, Trivy, Dependabot, GitHub, Quality Gates, SAST, DAST, Container Vulnerability Scanning

- Replaced hours of manual VM setup and tool configuration with a single reproducible deployment by architecting end-to-end CI/CD pipelines with integrated functional testing, SAST, DAST, and static code analysis and provisioning the entire Jenkins delivery infrastructure (controller, agent, SonarQube) end-to-end using IaC and automated bootstrap scripts.

- Enforced code quality and container security through a SonarQube static analysis stage that blocks pipeline progression on any quality gate failure, followed by version-tagged image build to a private registry and Trivy image scanning that halts deployment on any critical or high-severity vulnerability.
- Eliminated plain-text secrets from pipeline code by implementing least-privilege secrets management through a centralized credentials store with stage-scoped credential injection for GitHub tokens, cloud IAM credentials, SonarQube tokens, and SSH auth exposing each credential only within the specific stage that requires it.
- Eliminated per-service pipeline duplication that historically caused maintenance drift by engineering a reusable Groovy shared library with parameterized deployment workflows provisioning environment-specific Kubernetes namespaces on demand enabling pipeline changes to propagate across every service through a single library update.

Cloud-Based Food Delivery System Multi-Cloud Deployment Strategy | [Blog](#)

Django, AWS EC2, Azure Web App, MySQL, Nginx, Gunicorn, GitHub Actions

- Deployed the application across AWS and Azure in a multi-cloud architecture, reducing single-provider dependency and improving disaster recovery posture against regional outages, provider-level service degradations, and vendor lock-in risks.
- Hardened both deployments through automated CI/CD pipelines, TLS termination, IAM-scoped access controls, and strict network policies ensuring no database or internal service was exposed to the public internet across either cloud environment.

EDUCATION

University of Wisconsin Milwaukee

Aug 2023 – May 2025

Master of Science in Computer Science

Milwaukee, WI

Relevant Coursework: Cloud Computing, Cybersecurity, Database Systems, Machine Learning, NLP, Web Application Development

RESEARCH

Gandhi Institute of Technology and Management

March 2023

Research Assistant | [Springer ICDSAI 2023](#)

Visakhapatnam, India

- Designed and implemented an end-to-end sentiment classification pipeline that automatically scrapes, cleans, and processes large volumes of e-commerce product reviews through a multi-stage NLP workflow.
- Built and evaluated multiple machine learning classification models, optimizing for accuracy through cross-validation and confusion matrix analysis to identify the best-performing approach for real-world review data.
- Deployed the complete system as a Flask web application on AWS, enabling real-time sentiment prediction and word cloud visualization - with findings peer-reviewed and published in Springer ICDSAI 2023.
